# New in the Forcepoint Security Manager

Release Notes | Web, Data, and Email Security Solutions | 31-July-2017

Version 8.4 provides new names for Forcepoint products, as well as for key features and product modules.

Key management components were renamed as follows:

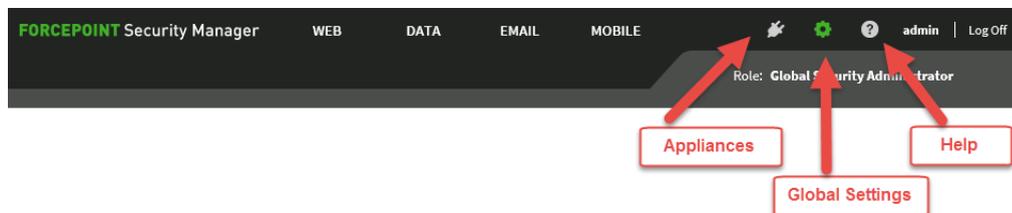

Old Name	New Name
TRITON Manager	Forcepoint Security Manager
TRITON Infrastructure	Forcepoint Management Infrastructure
TRITON Settings	Global Settings

The products configured via the management components were also renamed:

Old Name	New Name
TRITON AP-DATA	Forcepoint DLP
TRITON AP-EMAIL	Forcepoint Email Security
TRITON AP-WEB	Forcepoint Web Security
Web Filter and Security	Forcepoint URL Filtering

## Updated banner and toolbar

The Forcepoint Security Manager banner and toolbar have been updated. The consolidation of the Security Manager and product-specific toolbars leaves more screen space for the working areas of the user interface.

Administrators can access the Appliances and Global Settings (formerly TRITON Settings) interface, as well as the Help menu, via the icons in the banner.

The information in the dark gray tab updates according to which management module (Web Security, Data Security, Email Security, Mobile Security, Global Settings, or Appliances) is currently active.

## Supported browsers for the Security Manager

---

For the full list of supported browsers in this version, see the [Certified Product Matrix](#).

When you connect to Security Manager, you are presented with a self-signed certificate. The certificate names Forcepoint LLC as the Issuer. Because browsers do not recognize Forcepoint LLC as a known Certificate Authority, a certificate error is displayed the first time the Security Manager is launched from a new browser. To avoid seeing this error, install or permanently accept the certificate in the browser. After the security certificate is accepted, the logon page is displayed.

## Upgrade paths

---

All of the on-premises security solutions mentioned in this document can upgrade directly to version v8.4.0 from the following versions:

- v7.8.4
- v8.1.x
- v8.2.x
- v8.3.x

Note that direct upgrade is not supported from v8.0.x.

To learn more about the upgrade process and find upgrade instructions for a specific product or set of products, see the [Deployment and Installation Center](#).
